Water has memory & interacts with consciousness

#### **Evolution:** life on Earth is one big extended family

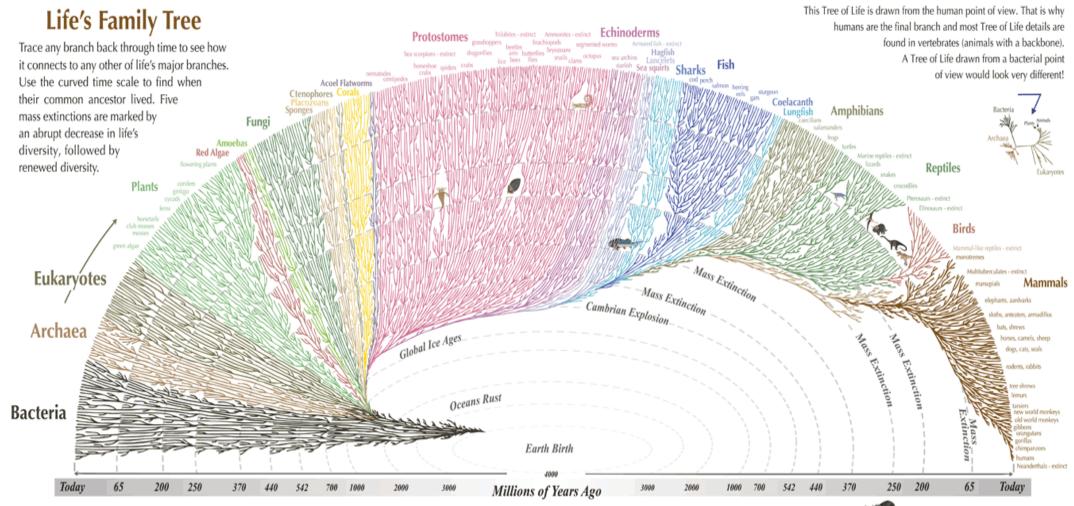

1858, Charles Darwin and Alfred Russel Wallace independently proposed a theory of biological evolution to explain the diversity of life on Earth. Since then the fossil record and DNA

studies have added, and continue to add, overwhelming support for this view of life's history. Evolution today is one of the best documented and widely accepted principles of modern science. Life on Earth has changed dramatically through time. The theory of evolution proposes that through the process of This means that all living things are natural selection and other natural related to one another through events stretching over millions of common ancestry with earlier, different

generations, living things diversify, branching from one species into many.

life forms. In other words, if you follow your family tree far enough back in time, you will find a common ancestor not only with every other living thing, but with every thing that ever lived.
