- Core Area
Diversey considers it to be best practices to have detailed room cleaning instructions, and shared with the hotels at the beginning of the outbreak. With the improvement of the epidemic situation, the hotels have begun to resume work. Based on this, we provide some general professional recommendations which involve of the standard elements of infection control, standard operation of hotel cleaning, and self-examination of hotel staff, and also focus on the cleaning and disinfection for the key areas of the hotel.

The recommendations for task frequency are based on Diversey’s best practice recommendations. A facility may choose to increase or decrease the frequency based on their tolerance for risk, which would impact their risk assessment.
Standard Elements of an Infection Prevention Program for Re-opening

Shown below is a list of elements to be included in an Infection Prevention program. This list was developed with non-Healthcare facilities in mind and would apply broadly to Hospitality facilities.

A. Preparation/Risk Assessment.
   The best Infection Prevention programs are developed before a time of crisis. Having a team that meets regularly and is empowered to make decisions for the facility is critical in identifying potential gaps in how the facility would respond to specific challenges, such as an outbreak of Influenza, Ebola, or MERS. After a facility risk assessment, the team should make recommendations, which may include modifications to facilities, such as adding handwashing stations or additional storage for Infection Prevention supplies which may be needed. These modifications take time, thus the need to plan before an outbreak. These modifications take time, thus the need to plan before an outbreak. The recommendations may also include having an extra supply of materials to be used for outbreaks.

B. Communication Materials
   If a Hospitality facility wants their customers/guests to perform certain behaviors, such as using alcohol hand rubs, having prepared signs and other communication materials are helpful in gaining compliance and having a professional appearance to the materials. When outbreaks occur, additional materials may be displayed telling guests and staff what Infection Prevention behaviors are desired.

C. Stock Supplies
   Diversey recommends supply levels should be set to provide 2-4 weeks of inventory of needed materials for routine use and 6-8 weeks of supply during outbreaks. When an outbreak occurs or there is a new pathogen of concern, knowing in advance what supplies will be needed and what the lead time is will help the facility be prepared. This can include cleaners, disinfectants, hand hygiene products, disposable wipers, paper towels, trash bags, toilet paper, extra garbage pickups, bottled water, gloves, gowns, masks, etc. The planning process should identify what is expected to be needed and how much additional to order.

D. Hand Hygiene
   The simplest most cost effective way to prevent the spread of pathogens is by frequent hand hygiene. Studies done in Healthcare demonstrate that access to hand hygiene is the best predictor of whether people will perform it frequently. The risk assessment should identify opportunities for staff and guests to perform hand hygiene and the materials needed to make hand hygiene convenient for them to perform.
E. Surface Cleaners/Disinfectants.  
Since clean hands that touch dirty surfaces negates the value of hand hygiene, having and using regularly a proper range of cleaners, disinfectants, and cleaning tools (cleaning cloths, spray bottles, etc.) is an important part of daily operation and preparation for an outbreak. While it may be necessary to change cleaning/disinfection products or increase the amount of cleaning being performed in the event of an outbreak or a new pathogen of concern, the preference is to not require changes during outbreaks to minimize confusion for staff.

F. Cleaning Practices, Standards and Schedules.  
All Hospitality facilities should have standard cleaning practices. These practices should detail the materials needed, the methods to use in cleaning, and the surfaces or equipment to be cleaned/disinfected. In the event of outbreaks or a new pathogen of concern, the planning process should identify how much the frequency will be increased or otherwise modified if this is desired to appropriately manage risk. Checklists and other work management tools should clearly identify what is expected of staff. Cleaning should include standard recommendations such as:

a. Maintain a constant flow in a room to avoid contamination of cleaned surfaces.

b. Perform hand hygiene before and after cleaning a room and when moving in/out of certain high risk areas, such as the bathroom.

c. Use PPE both to protect the worker from the chemicals (if appropriate) and to protect the worker from pathogens in the environment.

G. Personal Protective Equipment (PPE).  
Workers may need gloves, gowns, masks, and eye protection depending on the pathogens of concern. As with other elements of the facility plan, this should be considered in advance so that there are no questions around the use of the PPE when performing routine cleaning or for blood and body fluid cleanup. Workers will need training in how to use the PPE including correctly donning and taking off the PPE and doing hand hygiene before and after use of the PPE.

H. Vaccinations.  
Where possible, providing and/or requiring employee vaccinations helps protect the staff and prevent transmission of pathogens to guests/customers. Healthcare facilities in many countries are moving in the direction of requiring their employees to have annual Influenza vaccinations. We encourage this in other sectors as well where practical.

I. Compliance Monitoring.  
Many Healthcare facilities have programs to monitor hand hygiene, surface cleaning, and PPE usage compliance. In this way, they hold themselves accountable not just for having the policies, but for following them as well. Hospitality facilities should consider the use of compliance monitoring to ensure staff are performing as expected.
Environmental Infection Prevention Concerns for Hospitality

We can visualize Infection Prevention requirements for public facilities on a continuum, with any specific facility moving up or down the continuum as they respond to the expectations of their customers, their management, the general public, their regulatory authorities, and the impact of the media. Reasons why Hospitality facilities have higher needs than other public facilities include:

1. **Time spent in the facility.**
   Guests in a hotel will spend 8-12 hours per day in the facility, most of it in the same areas (guest room, restaurant, bar, lobby, and fitness center) versus other public facilities (bar, restaurant, gas station, or government building) where the public visits briefly. Many Hospitality guests spend several days at the same property, creating more opportunities for infection to occur and transmission to other guests.

2. **Guests come from a broad geographic area.**
   Many hotels in large cities have international guests, increasing the risk of a wider range of pathogens coming into the facility to be addressed. Past outbreaks, including SARS in 2003 in Hong Kong and Canada, started in a hotel with a visitor from outside the country, which then caused the pathogen to spread outside the hotel to other areas in that country.

3. **Lack of hand hygiene.**
   Few Hospitality properties have hand hygiene facilities broadly available to the guests and staff, making it more likely for guests and staff to contaminate their hands and cross-contaminate other people or surfaces.

4. **Frequent contact with surfaces capable of transmitting pathogens.**
   The use of high touch surfaces, such as door knobs, light switches, TV remotes, chair arms, table tops, telephones, sink handles, toilet seats and flush handles, and shower controls all receive multiple touches from guests in the course of their time in a hotel. These touches may repeat on a daily basis for the duration of the guest’s stay.
Introduction

The risk of pathogens infecting the general public is an ever present and serious risk for all public facilities and preventing the transmission of disease is an ongoing part of a facility’s risk management practice. In the event of an outbreak/epidemic, Healthcare facilities are well prepared to deal with the disease and do not generally have to change their practices. Even in a pandemic outbreak, Healthcare will have the policies in place to deal with the increase illness. However, for non-healthcare facilities, since Infection Prevention isn’t as strong a concern on a consistent basis, they may lack the knowledge and resources to determine the implications for their facility in the event of an outbreak/epidemic, pandemic, or new pathogen of concern.

This document was developed to provide a simple tool to assist non-healthcare public facilities in assessing their environmental infection prevention preparedness for an outbreak. While it does not cover all elements of an outbreak plan that could potentially be relevant, such as interruption of power, drinking water, food, sewer, and trash pickup, or labor issues, such as not having enough healthy staff to operate, these considerations may prevent the facility from operating, whereas the recommendations in this guide are designed to look specifically at environmental infection issues assuming the facility can otherwise be operational.

How to use this tool

The back of this document contains a list of areas that should be considered in performing an audit of outbreak preparedness. After completing the self-audit, total the score to compare to the ranges provided.
### Checklist

<table>
<thead>
<tr>
<th>1. Risk Assessment Planning</th>
<th>CIRCLE ONE</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low functioning:</strong> No outbreak preparation team, no written plans for the facility.</td>
<td>0</td>
</tr>
<tr>
<td><strong>Moderate functioning:</strong> Outbreak preparation team identified, but does not include all relevant departments, does not meet regularly, or not empowered to make changes to the facility that would require capital. If a plan exists, it does not identify anticipated supplies for an outbreak.</td>
<td>0</td>
</tr>
<tr>
<td><strong>High functioning:</strong> Outbreak team includes all relevant departments, can make changes to the facility, and is empowered to drive change within the facility. Outbreak plan has detailed list of supplies and quantities expected to be required for outbreak response.</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>2. Environmental Hygiene Plan</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low preparedness:</strong> Current facility hygiene plan contains little documentation, is not updated regularly, provides no formal training for employees, and plans for outbreak do not specify any changes needed to hygiene plan.</td>
<td>0</td>
</tr>
<tr>
<td><strong>Medium preparedness:</strong> Current facility hygiene plan has some documentation, but gaps exist in the plan, its training, and requirements for an outbreak.</td>
<td>0</td>
</tr>
<tr>
<td><strong>High preparedness:</strong> Current facility plan is updated regularly, is highly detailed, and is part of employee training. Documentation of employee training exists. Changes required for outbreaks already identified by pathogen or syndrome (acquired through shedding, respiratory, gastrointestinal, etc).</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>3. Stock Extra Supplies</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low preparedness:</strong> No clear direction for supplies that may be needed in an outbreak.</td>
<td>0</td>
</tr>
<tr>
<td><strong>Medium preparedness:</strong> List of supplies needed exists, but gaps identified in quantities or relationship to pathogen syndrome.</td>
<td>0</td>
</tr>
<tr>
<td><strong>High preparedness:</strong> Detailed list of required supplies identified with quantities and variations related to pathogen syndrome also clearly identified.</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>4. Training for Staff</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low preparedness:</strong> Lack of training and/or documentation of training for proper cleaning process, use of personal protective equipment, blood and body fluid cleanup. Minimal or no training materials available for staff.</td>
<td>0</td>
</tr>
<tr>
<td><strong>Medium preparedness:</strong> Some training materials available or some formal training conducted, but gaps identified that could contribute to performance issues.</td>
<td>0</td>
</tr>
<tr>
<td><strong>High preparedness:</strong> Written training materials in place for proper cleaning process, use of personal protective equipment, and blood and body fluid cleanup. Staff have personal copies of training and documentation that they have been trained in all practices.</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>5. Visitor/Guest Communication Materials</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low preparedness:</strong> No visitor or guest materials about hand hygiene, respiratory hygiene, vaccination, or other reminders in the event of an outbreak.</td>
<td>0</td>
</tr>
<tr>
<td><strong>Medium preparedness:</strong> Limited materials available, but clear gaps in placement or topics that would prevent an appropriate education.</td>
<td>0</td>
</tr>
<tr>
<td><strong>High preparedness:</strong> Range of materials available for visitors/guests across all relevant educational areas and in a variety of communication formats.</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>6. Hand Hygiene</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Low preparedness:</strong> There are few hand wash stations, and no located outside the toilet. Alcoholic hand sanitizers are rarely or not used.</td>
<td>0</td>
</tr>
<tr>
<td><strong>Medium preparedness:</strong> There have hand washing station outside the toilets in public areas, but the use of hand sanitizers and hand gel disinfectants has a problem of insufficient maintenance.</td>
<td>0</td>
</tr>
<tr>
<td><strong>High preparedness:</strong> All public areas have hand wash stations. Hand gel disinfectants are easily available for use in the public places.</td>
<td>0</td>
</tr>
</tbody>
</table>

**TOTAL SCORE**
### 7. Blood and Body Fluid (BBF) Cleanup
- **Low preparedness.** Handwashing stations located infrequently, not outside restrooms, and little to no use of alcohol hand gel.  
  - Score: 0 1 2
- **Medium preparedness.** Handwashing stations in some public areas outside of restrooms, but gaps identified where hand-washing or hand gel cannot easily be performed in public areas.  
  - Score: 0 1 2
- **High preparedness.** Handwashing stations available in all public areas. Hand gel available frequently in public areas.  
  - Score: 0 1 2

### 8. Respiratory Hygiene
- **Low preparedness.** No signage of proper respiratory hygiene. Tissues and trash cans not generally available in public areas.  
  - Score: 0 1 2
- **Medium preparedness.** Some signage and access to tissues/trash in public areas, but gaps identified in which areas have signage and access and which don’t.  
  - Score: 0 1 2
- **High preparedness.** Widespread use of communication materials, especially during cold and flu season. Tissues and trash available broadly through all public areas.  
  - Score: 0 1 2

### 9. Staff Personal Hygiene
- **Low preparedness.** Little attention paid to coaching staff on bathing, uniform cleanliness, hand hygiene, vaccinations, and other hygienic behaviors. No willingness to hold employees accountable for significant breaches in behavior.  
  - Score: 0 1 2
- **Medium preparedness.** Some attention paid to these topics, but clear gaps identified. Some willingness to hold employees accountable for personal hygiene behaviors.  
  - Score: 0 1 2
- **High preparedness.** Part of the employee’s training and HR policies is an adherence to specific personal hygiene behaviors. Required. Willingness to hold employees accountable for significant breaches in behavior.  
  - Score: 0 1 2

### 10. Vaccinations
- **Low preparedness.** No attention paid to vaccinations and annual influenza vaccination. Facility does not provide free influenza vaccinations each year for staff.  
  - Score: 0 1 2
- **Medium preparedness.** Some attention paid, but gaps identified in accountability to maintain current vaccinations. Facility may provide access to low cost influenza vaccinations, but are not required or are not free for employee.  
  - Score: 0 1 2
- **High preparedness.** Employees are required to keep an identified list of vaccinations current and free influenza vaccinations are provided to all employees (unless valid objection exists).  
  - Score: 0 1 2

### 11. Personal Protective Equipment (PPE)
- **Low preparedness.** Little documentation and required training on when to use PPE and how it changes by situation.  
  - Score: 0 1 2
- **Medium preparedness.** Some documentation exists, but gaps identified in which PPE to use, when to use it, or training and documentation. Little to no proof of competence used.  
  - Score: 0 1 2
- **High preparedness.** Clear documentation and training on PPE to use and when to use it. Proof of competence required as part of training. Auditing of use performed.  
  - Score: 0 1 2

### 12. Compliance Monitoring and Auditing
- **Low preparedness.** No formal auditing program of compliance in cleaning practices, PPE usage, hand hygiene, etc.  
  - Score: 0 1 2
- **Medium preparedness.** Some formal auditing, but gaps identified, such as infrequency of audits, only using visual audits for cleaning compliance, etc.  
  - Score: 0 1 2
- **High preparedness.** Formal auditing on a specified schedule that include measurements of cleaning, multiple auditors, variation in method of determining compliance, etc.  
  - Score: 0 1 2

### TOTAL SCORE

**Grand Total:**

After completing the self-rating above, add your score and compare to the scale below:

- **0-9 points.** Weak preparedness. Outbreaks will be highly disruptive to the facility. Significant opportunities to improve.
- **10-14 points.** Low preparedness. Outbreaks will be disruptive to the facility. Significant opportunities to improve.
- **15-19 points.** Medium preparedness. Outbreaks will cause some disruption. Some opportunities to improve.
- **20-24 points.** High preparedness. Outbreaks will cause minimal disruption. Limited areas to improve.

Please see your local Diversey representative for support in improving your outbreak prevention preparedness and call Diversey’s Customer Service with any questions.
Self examination of staff

Feeling sick? Should you be at work today?

It is up to you to protect our guests, and each other, from infectious diseases. Is it safe for you to start work today?

Before reporting for work, talk with your supervisor if you have ANY of these symptoms.

You may have a gastrointestinal illness or stomach bug (and should not work) if you have:
- Unexpected vomiting (in prior 24 hours)
- Diarrhea (2 or more episodes of runny or liquid stool (poop) in prior 24 hours)
- Jaundice (yellowing) of the eyes or skin

You may have another communicable (spreadable) illness if you have:
- Unusual tiredness (malaise) which may include body aches and/or headaches
- Dizziness and/or headache or body aches
- Fever or temperature over 99.1°F (37.3°C)
- Pink eye or goopy discharge from eye
- Fluid drainage from a cut in the skin which may be yellow/green and foul smelling
- Infected sores (often yellow/green color with swollen, red, itchy skin)

Foodborne illness is common. If you think you may have been exposed to someone infected with the big 5 foodborne pathogen (Shigella, E. coli, Salmonella, Hepatitis A, or Norovirus) or may be getting any of these symptoms, talk with your supervisor before reporting to work.

Skin infections usually begin with a cut or puncture to the skin. Tenderness/pain, swelling, redness of skin, and the skin being hot to the touch are typical symptoms. If the skin infection can be covered and the fluid leakage contained by bandages, and you have no fever (temperature), it may be safe to work. Check with your supervisor.

You may have a respiratory illness or bad cold (and should not work) if you have:
- Sore throat with Fever over 99.1°F (37.3°C)
- Coughing, sneezing, or wheezing with runny nose

The main cold and flu season is from October to March. You have a much higher risk of being exposed to people with colds and flu during this period and should talk with your supervisor before work if you think you are getting a respiratory illness.

Feelingsick? Should you be at work today?

It is up to you to protect our guests, and each other, from infectious diseases. Is it safe for you to start work today?

Before reporting for work, talk with your supervisor if you have ANY of these symptoms.
Assessment of staff health

Sick or Not Sick?

Should you be at work today?

Want to test your knowledge about whether a food handler is too sick to work? Can they be allowed to do food preparation or do they need to be put on restricted duty or sent home?

Questions:

1: The employee vomited once last night, but has not vomited this morning and shows no other symptoms of being sick.

2: The employee’s eyes appear to have developed a yellow color over the weekend. They feel a bit tired, but otherwise do not appear to be sick.

3: The employee’s eyes are puffy and their nose is runny, but they do not have a fever or sore throat.

4: The employee has a sore throat and fever of 99.1°F (37.3°C), but is not coughing or sneezing.

5: The employee had diarrhea last night and in the morning before reporting to work, but otherwise does not have symptoms.

6: The employee has a cut on their hand that can be covered with a bandage, but there is liquid from the cut saturating the bandage. The area around the cut is red and swollen and the area inside the cut is yellow and crusty. The skin is hot to the touch.

7: The employee felt fine when they reported for work, but had to leave their station for the bathroom and when they return, they state that they vomited and had diarrhea while in the bathroom.

8: The employee has coughed several times since the start of their shift, but is not coughing phlegm, does not have a fever or sore throat, and otherwise feels normal.

9: The employee was out drinking the night before and complains of a dry scratchy sore throat. They have coughed several times, but are otherwise not showing signs of being sick.

10: The employee says their spouse is sick with the flu, but the employee is not showing any symptoms of having the flu themselves.
Answers:

1: **Not sick.** This employee may have vomited for a number of reasons that have little to do with foodborne illness and as long as they do not show other symptoms and do not vomit again, they should be allowed to work.

- **SICK** - 
- **NOT SICK** - ✓

2: **Sick.** Yellow eyes or skin are a sign of Hepatitis A infection and the employee should not be allowed to work until they have been evaluated by a physician.

- **SICK** - ✓
- **NOT SICK** - 

3: **Not sick.** Not sick, but more questionable. A runny nose can signal a respiratory infection, but a lack of fever or sore throat likely means they have allergies or a type of allergic reaction. They can be allowed to work, but should be monitored to ensure they do not transfer respiratory secretions and should be expected to follow good respiratory hygiene practices (use of a tissue to blow their nose, scrupulous hand washing after blowing their nose, covering their nose/mouth with their elbow when coughing or sneezing). Consider restricting the employee from food preparation until their symptoms resolve.

- **SICK** - 
- **NOT SICK** - ✓

4: **Sick.** Fever over 99.1°F (37.3°C) and sore throat indicates the start of a cold or flu or what could be some other infection. Any employee with a high fever should see a physician and stay away from work for at least 24 hours after the fever stops (without needing medicine to control the body temp).

- **SICK** - 
- **NOT SICK** - 

5: **Sick.** While the employee may not feel very sick, more than one instance of diarrhea in a 24 hour period indicates a gastrointestinal infection (stomach bug) and they should not be allowed to work for at least 24 hours after the diarrhea stops.

- **SICK** - 
- **NOT SICK** - 

6: **Sick.** The cut is likely infected and they need to see a physician to determine if they need antibiotics. Even if the bandage can contain the drainage, the bandage is likely to become saturated and start to drip at some point during the day.

- **SICK** - 
- **NOT SICK** - 

7: **Sick.** Foodborne illness can have a sudden onset and this worker should be sent home. Also the bathroom they used (stall, sink, and other touch surfaces) and the station they were working at should be immediately cleaned with disinfectant to ensure they don’t infect someone else. Some foodborne illnesses are highly contagious, so monitor other employees to see if they develop symptoms of illness as well.

- **SICK** - 
- **NOT SICK** - 

8: **Not sick.** Coughing is a common reaction to many things. As long as they are using good respiratory hygiene, and are using hand sanitizer/soap and water and tissues as needed, they can be allowed to work.

- **SICK** - 
- **NOT SICK** - ✓

9: **Not sick.** The employee most likely is dehydrated and should drink several glasses of water. If they start to feel sick, develop a fever or start coughing up phlegm, they should be reassessed.

- **SICK** - 
- **NOT SICK** - ✓

10: **Not sick.** If the employee does not have symptoms, they can be allowed to work. However they should be monitored to see if they develop symptoms of illness.

- **SICK** - 
- **NOT SICK** - ✓

---

**How did you do?**

1-3 correct. New to the role. You will want training on how to determine when workers are too sick to work.

- **SICK** - 
- **NOT SICK** - 

4-6 correct. Needs additional training. You will want refresher training on how to determine when workers are too sick to work.

- **SICK** - 
- **NOT SICK** - 

7-9 correct. Excellent. You may want to review the questions you got wrong, but otherwise you are highly knowledgeable.

- **SICK** - 
- **NOT SICK** - 

10 correct. Superstar. You are ready to be a trainer.

- **SICK** - 
- **NOT SICK** -

Cleaning and Disinfecting

Disinfection Guide

1. Door knob
2. Toilet flush/handle
3. Toilet grab bar
4. Sink & faucets
5. Shower faucets
6. Soap dispenser (above the shower faucets)
7. Bathroom door
8. Phone
9. Lamp toggle switch
10. Closet/drawer pull handles
11. TV remotes & keyboards.

High Touch Surfaces Indication
As the table shows, a significant number of pathogens of common concern can have transmission interrupted by standard precautions. This demonstrates the need for Hospitality facilities to incorporate a number of standard precautions into their facility hygiene plans. Practices of safe injection and patient placement do not apply to non-Healthcare facilities, but the following standard precautions should be included in Hospitality facility hygiene plans.

- Hand hygiene
- PPE/barriers
- Environmental surface cleaning and disinfection
- Respiratory hygiene/cough etiquette
- Fabric handling

Since common environmental surfaces may or may not be contaminated with pathogens that can be transmitted by contact, it is better to err on the side of caution and teach workers to perform hand hygiene regularly, to use gloves during cleaning, and to treat any spill of liquid that could be a body fluid (urine, feces, vomit) as potentially infectious and to decontaminate/disinfect the spill during cleanup.

During outbreaks/epidemics/pandemics or time of unusual concern for a specific pathogen, facilities should have the ability to increase their hygiene practices to incorporate a higher level of infection prevention if desired. However, it should be noted that the risk of transmission of many pathogens in non-Healthcare facilities is supported by minimal evidence (formal clinical studies), so the development and implementation of enhanced hygiene practices in non-Healthcare facilities is based more on experience and judgment than published studies. Even with enhanced cleaning practices, this does not drive the risk of infection to zero, so enhanced cleaning practices are designed to provide an additional margin of error in ensuring established practices are being observed.

The table below shows several examples of how a facility hygiene plan might change in a hotel setting. The list below is not intended to be exhaustive, or to have any specific impact if taken in isolation. Selection of any specific enhanced hygiene procedures as part of a bundle should be a result of a risk assessment for the facility and a decision on how the enhanced practice is likely to lower risk for the facility when used within the bundle.
Using Disinfectants

Prior to any cleaning or disinfecting task, it is important to have all of the necessary tools, equipment, and chemicals required. This section includes some specific recommendations for use of disinfectants.

A. Use only registered products

In each country, the government will have an approval process to register disinfectants. Using governmental approved disinfectants ensures performance of the product.

B. One Step Cleaner Disinfectants

Some disinfectants were tested in the presence of organic soil to ensure that they will perform as expected even when organic soil is present. While gross soils always require a pre-cleaning step, most surfaces will have minimal soil when cleaning/disinfection is being done. Some disinfectants (2 step products) always require a cleaning step prior to disinfection, but the use of a one-step cleaner disinfectant ensures that workers can clean and disinfect in one pass.

C. Label Directions

All disinfectants must be used in compliance with their label directions. It is a violation of federal law in many countries to do otherwise. This includes following the approved application methods, observing contact time, and using the correct dilution for concentrates.

D. Use Dilution

For dilutable disinfectants, the label instructions for use will specify the acceptable use dilution to ensure the product is effective as a disinfectant. Changing the use dilution can make the product ineffective and increase health and safety risks associated with using the disinfectant.

E. Contact Time

The product label will specify the wet contact time needed to ensure the disinfectant is effective. If the surface dries prior to the wet contact time, there’s no guarantee that the product has killed the pathogens claimed on the label.

F. Health and Safety Considerations

The product label and SDS provide the relevant health and safety information on how to use disinfectants. Both the label and SDS should be read prior to using a product. The use of PPE may be required. If required, it would be listed on the SDS and possibly the product label as well. Always use appropriate PPE if required to avoid the risk of personal injury.

Formalized Cleaning Practices

Diversey considers it to be best practice to have detailed room cleaning instructions that include:

- The specific surfaces to be cleaned in a room
- The order in which the surfaces are to be cleaned
- When hand hygiene should be performed
- Whether glove use is required
- Cleaning/disinfection products to use
- Tools to use

An example of the training materials used with staff for cleaning a lobby following this approach is shown on the following page. Diversey recommends having these materials for all major areas of a facility.

Summary

In summary, determining the correct practices for Infection Prevention for non-Healthcare facilities is a challenging task requiring significant amounts of work in performing a risk assessment for the various areas of a facility. Enhanced hygiene practices can be implemented as a bundle to provide risk reduction of pathogen transmission for a facility based on an understanding of modes of transmission and the bundle needed to effect a change in risk of transmission.
Hygiene Laundry Linen Guidelines

These hygienic linen guidelines are developed for hospitality and commercial laundry to ensure maximum hygiene during the washing process and to minimize risk of contamination with a pathogen via linen. Following these procedures reduces the risk of contamination with disease-causing pathogens.

1. Do not leave linen on the floor or dirty surfaces.

2. All trolley / bags handling linen must be washed and cleaned daily.
   ✓ Trolley / bags for dirty linen should only be used for dirty linen.
   ✓ Trolley / bags for clean linen should only be used for clean linen to avoid cross contamination.

3. Housekeeping and Laundry staff must wear gloves to sort dirty linen.
   ✓ After handling soiled linen, staff must wash their hands immediately before handling clean linen to avoid cross contamination.
   ✓ Clean hands regularly and when removing gloves or moving from the dirty to the clean area.
   ✓ Ensure a hand washing station is available in the laundry with hand soap and sanitizer.

4. All linen must go through a full washing & drying process to ensure complete soil removal and to remove pathogens from linen.
   ✓ Follow standard washing programs.
   ✓ Select the correct programs on the washing machine for each classification. Washing temperature should be 75 °C ≥30 minutes or 80 °C ≥10 minutes (according to WS / T 508-2016), or follow the calculation result of Diversey Netherlands NTO formula (use oxygen ≥250ppm, use chlorine ≥180ppm)
   ✓ Load the machine as recommended to achieve effective soil removal and proper hygiene.
   ✓ Avoid overloading machines.
   ✓ No shortcuts are allowed during washing processes because this may leave soil, pathogens or chemicals in the linen.
   ✓ Replace empty chemical canisters quickly.

5. Do not use starch on linen.
6. Ensure clear separation between clean and soiled linen during the entire laundry process to avoid cross contamination.
   - Clean linen cannot be in contact with soiled linen at any time.
   - When dirty linen is brought on trolleys, do not place clean linen on the same trolley to avoid cross contamination, unless the trolley that has been cleaned and sanitized.
   - When clean linen contacts dirty linen, it becomes dirty linen. Assume that cross contamination has taken place. This linen must go through another full wash and drying process before use.

7. Ensure linen is completely dried and aired before leaving the laundry.
   - Linen must be dried or ironed within two hours of washing to avoid bacterial/mildew growth that is accelerated by dampness.

8. Ensure ironing temperature is between 105 °C and 110 °C right after pressing.
   - Measure temperature with an infrared temperature gun.
   - Make sure linen is dry to prevent mildew.
   - If the temperature is too low, adjust the speed down.
   - If the temperature is too high, adjust speed higher.

9. Linen storage rooms must have ventilation with low humidity.

10. Practice FIFO policy for linen storage.
    - FIFO = First In – First Out
    - Items that are stored first must be taken out first to ensure that all linens are circulated. This avoids items being kept in the storage room for too long.

11. Keep the laundry floor, walls, and equipment clean with a cleaner/sanitizer.

    - Keep a minimum buffer stock at all times according to local conditions.

13. Good maintenance of washing and drying machines is essential to meet hygiene standards.
    - Water levels in washing machines need to reach the programmed levels to ensure effectively cleaning.
    - Maintain a sufficient supply of water and required water pressure for washing machines.

14. Ensure water quality is up to standard.
Different governmental and global health organizations all provide guidance in performing decontamination of blood and body fluid (BBF) spills in commercial facilities on hard non-porous surfaces. While some of the guidance is intended primarily for a Healthcare audience, the governmental guidance usually applies to any commercial facility. As the disinfectants used to decontaminate these surfaces are required to be registered with the country government, their requirements for product labeling of disinfectants for hard surface decontamination are also relevant to this discussion.

For public facilities, including Healthcare facilities, body fluid spills such as blood, feces and vomit on hard non-porous environmental surfaces must be decontaminated to protect public health. The procedure must also protect the worker during decontamination.

While the procedure for BBF cleanup is largely the same regardless of the spill size, there is more risk associated with large spill BBF cleanup, so there are some additional steps recommended as shown.

Recommended Procedures:

1. Assess the size of the spill and determine whether to treat as a large spill or a small spill.
2. Perform hand hygiene and put on appropriate Personal Protective Equipment (PPE) to prevent blood-borne pathogen exposure during decontamination, including disposable latex, vinyl, or nitrile gloves, fluid resistant gowns, face masks and eye covering (goggles or face shield). Note that for certain disinfectants or if there is a risk of splashing during the cleanup, additional PPE may be required. Refer to the SDS for the disinfectant for additional information.
3. Perform one of the following procedures for Small Spill or Large Spill surface decontamination.
4. Remove PPE, dispose of PPE appropriately, and perform hand hygiene.

Small spills

1. Wipe up a small BBF spill with paper towel or similar disposable absorbent material. Discard in red bag (bio-hazard) trash.
2. Clean the surface using an appropriate cleaner or cleaner/disinfectant to remove all of the gross soil and any BBF residues. Cleaning cloths used in BBF decontamination should be treated as contaminated and laundered or disposed of appropriately.
3. Disinfect the surface with a registered disinfectant that contains a blood-borne pathogen claim and apply according to the directions on the label. Ensure surfaces stay wet for the contact time of the disinfectant, reapplying the disinfectant if needed to keep the surface wet for the full contact time. Cleaning cloths used in BBF decontamination should be treated as contaminated and laundered or disposed of appropriately.
4. Once the contact time of the disinfectant has lapsed and the surface has air dried, the surface can be returned to normal use.

Large spills

1. Absorb and/or wipe up BBF or other organic material with paper towels, absorbent granules, or similar material. Discard in red bag (bio-hazard) trash.
2. Clean the surface using an appropriate cleaner or cleaner/disinfectant to remove all of the gross soil and any BBF residues. Cleaning cloths used in BBF decontamination should be treated as contaminated and laundered or disposed of appropriately.
3. Disinfect the surface with a registered disinfectant that contains a blood-borne pathogen claim and apply according to the directions on the label. Ensure surfaces stay wet for the contact time of the disinfectant, reapplying the disinfectant if needed to keep the surface wet for the full contact time. Cleaning cloths used in BBF decontamination should be treated as contaminated and laundered or disposed of appropriately.
4. Once the contact time of the disinfectant has lapsed and the surface has air dried, the surface can be returned to normal use.
In labs, research areas, and other higher risk areas, with a large spill, use these steps:

Perform hand hygiene and put on appropriate Personal Protective Equipment (PPE) to prevent blood-borne pathogen exposure during decontamination, including disposable latex, vinyl, or nitrile gloves, fluid resistant gowns, face masks and eye covering (goggles or face shield). Note that for certain disinfectants or if there is a risk of splashing during the cleanup, additional PPE may be required. Refer to the SDS for the disinfectant for additional information.

1. Confine the contaminated area using absorbent or barriers.

2. Flood the contaminated area using an intermediate level disinfectant or 5,000+ ppm of sodium hypochlorite and allow to stand for the contact time of the disinfectant. Wipe up using paper towels or other absorbent materials. Discard in red bag (bio-hazard) trash.

3. Clean the surface using an appropriate cleaner or cleaner/disinfectant to remove all of the gross soil and any BBF residues. Cleaning cloths used in BBF decontamination should be treated as contaminated and laundered or disposed of appropriately.

4. Disinfect the surface with a registered disinfectant that contains a blood-borne pathogen claim and apply according to the directions on the label. Ensure surfaces stay wet for the contact time of the disinfectant, reapplying the disinfectant if needed to keep the surface wet for the full contact time. Cleaning cloths used in BBF decontamination should be treated as contaminated and laundered or disposed of appropriately.

5. Once the contact time of the disinfectant has lapsed and the surface has air dried and, the surface can be returned to normal use.

6. Remove PPE, dispose of PPE appropriately, and perform hand hygiene.

Additional precautions: the following precautions apply to all BBF cleanup procedures:

1. Broken glassware and other sharp objects which may be contaminated shall not be picked up directly with the hands. It shall be cleaned up using mechanical means, such as a tongs, forceps, or scraper and dust pan. Discard in red bag (bio-hazard) trash.

2. Sharps which may be contaminated shall not be picked up directly with the hands. It shall be cleaned up using mechanical means, such as a tongs, forceps, or scraper and dust pan and placed in an appropriate sharps receptacle.

3. Reusable materials, such as cleaning tools, scrapers, dust pans, etc. (i.e. materials that cannot be laundered) and all reusable PPE must be manually disinfected after cleaning up a BBF spill before they can be reused.

4. Disposal of Infectious Material: Blood and other body fluids should be disposed of according to Federal, State, and local regulations for infectious waste disposal.

If you have any questions, please contact Diversey Customer Technical Support on your local number.

The process discussed is based on the following recommendations:

1. EPA label requirements as found in the EPA Label Review Manual
**Cleaning and disinfection recommendations for Core Area**

**Clean and Disinfect High Touch Surfaces in Guest Rooms, Public Areas.** Commonly touched surfaces (door handles, light switches, elevator buttons, faucet handles, TV remotes, phones, keyboards, gym/fitness equipment etc.) should be disinfected regularly or when visibly soiled using a disinfectant that is effective against norovirus.

**Cleaning Best Practices**
Increase cleaning frequency during an outbreak. Gloves, masks and other personal protective equipment should be worn. The level of cleaning should be based upon the extent of any outbreak:

Be mindful to disinfect all high-touch surfaces in guest rooms, bathrooms and also in public areas.

Make disinfectant wipes, sanitisers, and masks available at points of entry to the lobby and in public areas. Clean and disinfect public areas frequently (no less that every 2 hours)

Make ready to use disinfectants or disinfectant wipes available for employees.
- Clean from high to low.
- Clean from the cleanest to dirtiest.
- Clean from dry to wet.
- Maintain a constant flow such as working in a clockwise direction around the room so no areas are missed.

## Target Frequency by Risk Level

### Guest Room
- **Disinfect hand contact surfaces**: Daily
- **Bathroom floor**: Daily cleaning
- **Staff hand hygiene**: Twice per room
- **Fabric handling**: Normal practice
- **Hand contact surface disinfection**: Disinfected daily
- **Staff hand hygiene**: Twice/shift
- **Guest hand hygiene**: N/A
- **Vehicle interior**: Disinfected daily
- **Staff hand hygiene**: Twice per shift
- **Guest hand hygiene**: N/A
- **Blood/body fluid cleanup**: Hand hygiene/PPE + special waste handling

### Business Center/Offices
- **Hand contact surface disinfection**: Disinfected daily
- **Staff hand hygiene**: Twice/shift
- **Guest hand hygiene**: N/A

### Elevators
- **Hand contact surface disinfection**: Disinfected daily

### Vending Area
- **Disinfect hand contact surfaces**: Disinfected daily
- **Fabric handling**: Normal practice

### Laundry
- **Fabric handling**: Normal practice
- **Laundry carts and work surfaces**: Disinfected daily

### Shuttle Bus
- **Vehicle interior**: Disinfected daily
- **Staff hand hygiene**: Twice per shift
- **Guest hand hygiene**: N/A

### Special Cleaning
- **Blood/body fluid cleanup**: Hand hygiene/PPE + special waste handling
- **Hand hygiene/PPE**: Hand hygiene/PPE + special waste handling
